Literary Miscellany is a breezy tour through the literature of today and yesterday, touching on many great classical literary works, movements, and trends. But don't fear that it's only for intellectuals—there's plenty here for the contemporary pleasure reader as well. Alex Palmer offers something for everyone, including answers to the following questions: What's the original bestseller? What authors introduced insults as a literary art form? Who burned the first book? Are writers more likely to be depressed than booksellers? How does a book become a movie? When did sex become part of literature? Most people don't know that the Bible gets credit for plenty of lines that were written by William Shakespeare or John Milton. In *Literary Miscellany*, learn how this happened. Also examine the more recent concept of "false memoirs," with a list of who lied about what. And speaking of villains, was the devil the first bad guy in print? Did his appearance lead to the inevitable self-help book? Or was that Oprah? This quirky work is filled with entertaining literary trivia for a unique perspective on writers' lives and inspirations, from the drinks they imbibed to the books they penned. Delightfully illustrated, it will entertain casual readers and literary buffs alike.

Surfaces are among the most common and easily visualized mathematical objects, and their study brings into focus fundamental ideas, concepts, and methods from geometry, topology, complex analysis, Morse theory, and group theory. At the same time, many of those notions appear in a technically simpler and more graphic form than in their general 'natural' settings. The first, primarily expository, chapter introduces many of the principal actors - the round sphere, flat torus, Mobius strip, Klein bottle, elliptic plane, etc. - as well as various methods of describing surfaces, beginning with the traditional representation by equations in three-dimensional space, proceeding to parametric representation, and also introducing the less intuitive, but central for our purposes, representation as factor spaces. It concludes with a preliminary discussion of the metric geometry of surfaces, and the associated isometry groups. Subsequent chapters introduce fundamental mathematical structures - topological, combinatorial (piecewise linear), smooth, Riemannian (metric), and complex - in the specific context of surfaces. The focal point of the book is the Euler characteristic, which appears in many different guises and ties together concepts from combinatorics, algebraic topology, Morse theory, ordinary differential equations, and Riemannian geometry. The repeated appearance of the Euler characteristic provides both a unifying theme and a powerful illustration of the notion of an invariant in all those theories. The assumed background is the standard calculus sequence, some linear algebra, and rudiments of ODE and real analysis. All notions are introduced and discussed, and virtually all results proved, based on this background. This book is a result of the MASS course in geometry in the fall semester of 2007.

My book is the work of Comparative religious theology and apologetics, of the late 1960s to 2000, Order of Mans cult. It examines the founder, teachings of the Order, in light of scriptures. Biblical gumshoe P.I. (private investigator) Vance McGarrett and assistant Scarlet Script investigate a religious group called the Holy Order of Mans. The Order was founded by a shady character named Earl Blighton who is the supposed reincarnation of St. Paul. The order has a bona fide grant from the state of California to grant degrees and ordination. As it grows, it takes on Orientalism and Gnosticism. McGarrett exposes the seamy side of religious organizations in this investigation and gives fair warning to the innocent about the many scams that flourish on the market stalls on the way to Christian salvation.

Hard Science Fiction Films that Predict the Future "As the breakneck advance of technology takes us into a world that is both exciting and menacing, sci-fi films give us an inkling of what is to come, and what we should avoid." —Seth Shostak, senior astronomer at the SETI Institute, and host of Big Picture Science #1 Best Seller in Nanotechnology and Computers & Technology Dr. Andrew Maynard, physicist and leading expert on socially responsible development of emerging and converging technologies, examines science fiction movies and brings them to life. Advances in science and technology are radically changing our world. Films from the Future is an essential guide to navigating a future dominated by complex and powerful new technologies. The jump from room-filling processors to pocket-size super computers is just the beginning. Artificial intelligence, gene manipulation, cloning, and inter-planet travel are all ideas that seemed like fairy tales but a few years ago. And now their possibility is very much here. But are we ready to handle these advances? As Maynard explains, "Viewed in the right way?and with a good dose of critical thinking?science fiction movies can help us think about and prepare for the social consequences of technologies we don't yet have, but that are coming faster than we imagine." Films from the Future looks at twelve movies that take readers on a journey through the worlds of biological and genetic manipulation, human enhancement, cyber technologies, and nanotechnology. Gain a broader understanding of the complex relationship between science and society. The movies include old and new, and the familiar and unfamiliar, to provide a unique, entertaining, and ultimately transformative take on the power and responsibilities of emerging technologies. If you have read books such as The Book of Why, The Science of Interstellar, or The Future of Humanity, you will love Films from the Future.

One of the world's most beloved and bestselling writers takes his ultimate journey -- into the most intriguing and intractable questions that science seeks to answer. In A Walk in the Woods, Bill Bryson trekked the Appalachian Trail -- well, most of it. In In A Sunburned Country, he confronted some of the most lethal wildlife Australia has to offer. Now, in his biggest book, he confronts his greatest challenge: to understand -- and, if possible, answer -- the oldest, biggest questions we have posed about the universe and ourselves. Taking as territory everything from the Big Bang to the rise of civilization, Bryson seeks to understand how we got from there being nothing at all to there being us. To that end, he has attached himself to a host of the world's most advanced (and often obsessed) archaeologists, anthropologists, and mathematicians, travelling to their offices, laboratories, and field camps. He has read (or tried to read) their books, pestered them with questions, apprenticed himself to their powerful minds. A Short History of Nearly Everything is the record of this quest, and it is a sometimes profound, sometimes funny, and always supremely clear and entertaining adventure in the realms of human knowledge, as only Bill Bryson can render it. Science has never been more involving or entertaining.

Whatever its faults, the Indian bureaucracy cannot be accused of bias when it comes to confounding those who have to deal with it. Veteran insiders who return to it with their petitions after retirement are as clueless about how it functions as freshly minted supplicants. Outsiders in any case have little knowledge of who is responsible for what and why or how to navigate that critical proposal through the treacherous shoals of the secretariat. At the top of the heap is the fast-tracked elite civil servant, who belongs to a group of generalist and specialized services selected through a competitive examination. The aura of the Indian Administrative Service has remained intact over the years. Lack of awe, bordering on civilized disrespect, is a most effective learning tool. In this humorous, practical book, T.R. Raghunandan aims to deconstruct the structure of the bureaucracy and how it functions, for the understanding of the common person and replaces the anxiety that people feel when they step into a government office with a healthy dollop of irreverence.

'A modernist work of art is by definition 'incomprehensible'; it functions as a shock, as the irruption of a trauma which

undermines the complacency of our daily routine and resists being integrated. What postmodernism does, however, is the very opposite: it objects par excellence are products with mass appeal; the aim of the postmodernist treatment is to estrange their initial homeliness: 'you think what you see is a simple melodrama your granny would have no difficulty in following? Yet without taking into account the difference between symptom and sinthom/the structure of the Borromean knot/the fact that Woman is one of the Names-of-the-Father ... you've totally missed the point!' if there is an author whose name epitomises this interpretive pleasure of 'estranging' the most banal content, it is Alfred Hitchcock (and—useless to deny it—this book partakes unrestrainedly in this madness).' Hitchcock is placed on the analyst's couch in this extraordinary volume of case studies, as its contributors bring to bear an unrivalled enthusiasm and theoretical sweep on the entire Hitchcock oeuvre, from Rear Window to Psycho, as an exemplar of 'postmodern' defamiliarization. Starting from the premise that 'everything has meaning', the films' ostensible narrative content and formal procedures are analysed to reveal a rich proliferation of ideological and psychical mechanisms at work. But Hitchcock is here to lure the reader into 'serious' Marxist and Lacanian considerations on the construction of meaning. Timely, provocative and original, this is sure to become a landmark of Hitchcock studies. Contributors: Frederic Jameson, Pascal Bonitzer, Miran Bozovic, Michel Chion, Mladen Dolar, Stojan Pellko, Renata Salecl, Alenka Zupancic and Slavoj Zizek.

These notes describe how to average and fit numerical data that have been obtained either by simulation or measurement. Following an introduction on how to estimate various average values, they discuss how to determine error bars on those estimates, and how to proceed for combinations of measured values. Techniques for fitting data to a given set of models will be described in the second part of these notes. This primer equips readers to properly derive the results covered, presenting the content in a style suitable for a physics audience. It also includes scripts in python, perl and gnuplot for performing a number of tasks in data analysis and fitting, thereby providing readers with a useful reference guide.

World history is not a subject; it is all the subjects. Because of this, world history as a discipline has never fit well with the traditional definition of historical research. H.G. Wells wrote the first true book of world history in 1920 and only a few authors have made the attempt to "explain it all" since Wells. In that time, world history has become the chosen subject of polymaths and possesses the most potential to unite all of the fields of knowledge. The subject of world history has developed several approaches, with "Big History" being the most modern, and flawed, of its variants.
